

Protect your expensive pond fish from Heron attack with these economical, easy-to-fit floating net rings.

Netfloat pond protection rings are quick and easy to fit and suit any size and shape of pond. Herons and other predators will only strike at the edge, so there is no need to cover your whole pond. There are no unsightly frames or fixings, and no tools are required. Whether you choose the circular Netfloat (best for small or irregularly shaped ponds) or the rectangular Netfloat (best for large or square/rectangular ponds) the process is the same.

Heron and other predators will only strike at the edge, so there is no need to cover your whole pond. There are no unsightly frames or fixings, and no tools are required.

STEP 1

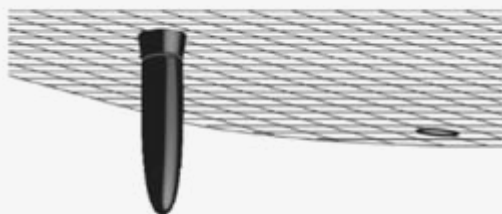

Lay the first Netfloat mat in your pond length ways towards the centre of the pond.

No pins are required for the first mat.

Temporarily attach a length of string to this mat to secure to the side of the pond to prevent initial movement (remove string when complete)

STEP 2

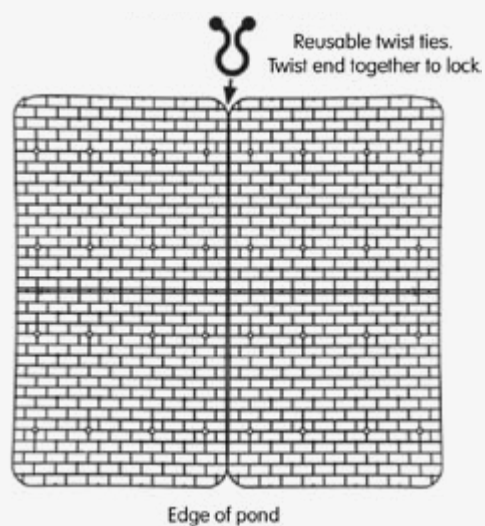

Insert the two connector pins top and bottom into the second Netfloat mat.

With the pins facing down, position and place over the first mat using any of the squares in the mat.

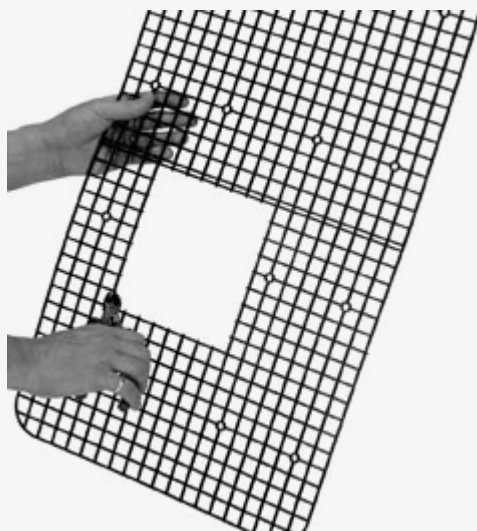

Repeat this process until you have completed the circumference of the pond.

STEP 3

Secure overlapping edges of each Netfloat mat in the centre using the twist ties.

STEP 4

Netfloat mats can be cut with secateurs or strong scissors to allow for plants and other obstacles.
